 TITLE : Effect of a Reducing Kiln Atmosphere on the Properties of Basic Chromite-Containing Refractories
 ORIG. PUB. : Tekhnika, 13, No 8, 1958; Mas Ind, 12, No 8, 117-119 (1958)
 ABSTRACT : At the Magnokhrom refractories plant (Kralovo, Yugoslav Federal Peoples Republic) excessive shrinkage and deformation were observed in a number of cases during the firing of Cr-containing wares--chrome-magnesite (C) and magnesia-chromite (M), the respective compositions of which are as follows (in wt %): MgO 47 and 75, Cr₂O₃ 20-30 and 10-12, SiO₂ 5-6 and 4.5, Fe₂O₃ 8.5 and 1, CaO 2.5 and 3, and Al₂O₃ 7-10 and 3. The cause for the shrinkage apparently is the presence of

ABSTRACT	: CO in the atmosphere of the firing kiln. In order to confirm this deduction, specimens of C and M were fired in weakly oxidising and in strongly reducing atmospheres in laboratory furnaces at 1,700° (15 min firing time). The effect of reducing atmospheres was greatest in the case of specimens which exhibited markedly increased shrinkage (by 1.8%) and the surface of which showed areas of high light reflection. All of the above phenomena can be explained on the basis

"Resistance of *Aspergillus fumigatus* to Some Types of Disinfectants"

Belgrade, *Veterinarski Glasnik*, Vol 20, No 10, 1966, p. 763-765

Abstract [English summary modified]: A pathogenic strain of *Aspergillus fumigatus*, isolated from an acute outbreak of aspergillosis in hens, was tested for in vitro sensitivity to 10 common disinfectants. Corrosive sublimate (mercuric chloride) was most effective; the invert-soap preparation Tego 51 was least so. In view of toxicity of sublimate, formaldehyde or copper sulphate were considered best for practical use. Table, 1 Soviet, 3 Western references. Manuscript received 13 Jul 66.

"Comparative Tests of the Prophylactic Effect of the Coccidiostats Nitrofurazon, Zoamix, and Amprolmix."

Belgrade, Acta Veterinaria, Vol 13, No 1, 1963, pp 29-35.

Abstract: [Authors' English summary modified] The authors examined the effects of the aforementioned coccidiostats on macro- and micro-lesions in the caeca (third, fifth, seventh, and tenth days after infection) and on the number of oocysts produced (seventh and tenth days after infection) in two experiments with chicks infected experimentally with *Eimeria tenella*. The influence of the same coccidiostats on growth and mortality was examined during the first 60 days in two other experiments. The authors found that the best prophylactic effect was achieved in the groups fed with amprolmix in mashed feed.

"Clinical Problems of Diuresis in Patients Suffering from Decompensated Cirrhosis of the Liver."

Zagreb, Liječnicki Vjesnik, Vol 85, No 7, July 1963, pp 699-711.

Abstract: [Author's English summary modified] The authors studied diuresis and salt excretion in 26 of 50 patients suffering from decompensated cirrhosis of the liver and treated with hydrochlorothiazides. The ascites was absorbed in the first group of 17 patients, while treatment was without result in the remaining nine cases. More urine was produced in the first group. There were low levels of sodium, potassium, and chlorides in the patients. Higher levels of ammonia did not appear dependent on low levels of potassium. Treatment with hydrochlorothiazides did not appear to influence the effect of aldosterone. In view of the number of lymphocytes in the peripheral blood, it appeared possible that hydrochlorothiazides might lower portal hypertension in such patients by promoting more water diuresis than sodium excretion, a hypothesis needful of further investigation. Hydrochlorothiazide treatment made no essential change in the survival period in that 64 percent (of 48 out of the 50 patients) died after an average observation period of 13 months and 14 1/1 days. Total of 38 recent references (mainly Western, some Yugoslav).

"Postbulbar Peptic Ulcers of the Duodenum"

Zagreb, Idjecnicki Vjesnik, Vol 87, No 12, 1965, pp 1339-1345.

Abstract/Authors' English summary/: The authors stress the clin-
ical and roentgenological symptomatology of postbulbar ulcers
because of their abundant hemorrhages and diagnostic difficul-
ties. They point out that these ulcers very often remain undis-
covered in routine gastroduodenal examinations. By early and
correct diagnosis serious complications can be avoided in a great
degree. 3 Yugoslav, 7 Western references.

Title : Note on the Feasibility of the Boron Fluoride
Monohydrate Process of Boron Isotope Separation
Orig Pub : Bull. Inst. Nucl. Sci. 1959, 9, No 167, 111-113
Abstract : The process of separation of boron isotopes is based on
the exchange between boron trifluoride and monohydrate
of boron trifluoride in the presence of counter flow.
The following reaction takes place: $BF_3 \cdot H_2O + SO_3$
 $BF_3 + H_2SO_4$. The sulfur trioxide converts the monohy-
drate into gaseous boron trifluoride, and the latter is

well dissolved in the resultant sulfuric acid. For the
most effective course of the process it is necessary to
satisfy the following conditions: 1) the acid tempera-
ture must be maintained at 220° C; 2) the pressure must
be maintained at 100 mm mercury; 3) remove the gas only
from the enriched acid; 4) part of the acid (approxima-
tely 60%) should be directed back to the counterflow
process. By observing all these conditions, the authors
have succeeded in obtaining 99% pure B_2O_3 . -- N.S.
Babayev

 TITLE : Catalytic Cracking Unit at the Sisak
 Petroleum Refinery
 ORIG. PUB. : Tehnika, 1959, 14, No 3, Hem. ind., 13,
 No 3, 37-45
 ABSTRACT : Description of an "Orthoflow" catalytic
 cracking unit (with reactor at the top), in operation since
 1956, and an assessment of its advantages based upon results
 of two years of operation. Specific features of operation
 of the cyclones are noted; processes of fluidizing and
 circulation of catalyst are considered, and also erosion-
 prevention means. Characteristics of raw material (heavy
 gas oil) and of resulting products are given.

Catalytic Cracking in the Petroleum Refinery of Sloba
(Katalitičko kretanje u Rafineriji nafte u Slobi)

ABSTRACT:

Sobalva, 1979, No. 3, pp. 341-349 (1979)

The article deals with the "Turbine" 12 field oil
treacher, part of the Combustion Unit at the Petro-
chem Refinery at Sloba. The oil treacher is designed by
"7. Trak Odel" in Dortmund with the assistance of
under license from the "L. K. Kollig Co". The Treacher
and can crack 205 tons of crude a day. An outline of
the operation of the unit is given and the author
describes in some detail the corrosion caused by the
catalytic catalyst. Suggestions are made on how to
reduce and avoid this damage. The quality of the

Title : Intoxication of Chickens by Phosphorus Preparations

Orig Pub : Veterin. glasnik, 1956, 10, No 10, 783-785

Abstract : Cases of intoxication of chickens by phosphorus preparations used for the destruction of rodents became more frequent in Belgrade and its area in 1955 and the first half of 1956. Of all diseased chickens in 1955, 43.2% were suffering from P intoxication, while during the first half of 1956 the number of intoxicated birds rose to 60.6%. Mortality among chickens because of intoxication was considerably greater than that from plague and cholera. The author thinks it necessary to limit the free sale of P preparations.
